

Figure 3-10. Rolling statistics on Google stock prices

As with groupby operations, the `aggregate()` and `apply()` methods can be used for custom rolling computations.

Where to Learn More

This section has provided only a brief summary of some of the most essential features of time series tools provided by Pandas; for a more complete discussion, you can refer to the “Time Series/Date” section of the [Pandas online documentation](#).

Another excellent resource is the textbook *Python for Data Analysis* by Wes McKinney (O’Reilly, 2012). Although it is now a few years old, it is an invaluable resource on the use of Pandas. In particular, this book emphasizes time series tools in the context of business and finance, and focuses much more on particular details of business calendars, time zones, and related topics.

As always, you can also use the IPython help functionality to explore and try further options available to the functions and methods discussed here. I find this often is the best way to learn a new Python tool.

Example: Visualizing Seattle Bicycle Counts

As a more involved example of working with some time series data, let’s take a look at bicycle counts on Seattle’s **Fremont Bridge**. This data comes from an automated bicycle counter, installed in late 2012, which has inductive sensors on the east and west sidewalks of the bridge. The hourly bicycle counts can be downloaded from <http://data.seattle.gov/>; here is the [direct link to the dataset](#).

As of summer 2016, the CSV can be downloaded as follows:
